Posted September 13, 2016.

*Article based on a full paper published in the *GCAGS Transactions* (see footnote reference below), which is available as part of the entire 2016 *GCAGS Transactions* volume via the GCAGS Bookstore at the Bureau of Economic Geology (www.beg.utexas.edu) or as an individual document via AAPG Datapages, Inc. (www.datapages.com), and delivered as an oral presentation at the 66th Annual GCAGS Convention and 63rd Annual GCSSEPM Meeting in Corpus Christi, Texas, September 18–20, 2016.

ABSTRACT

The best exploration portfolio is the aggregation of projects that best meets or exceeds key corporate objectives, usually though maximizing value and minimizing financial risk. Unfortunately, the annual results of exploration portfolios are notoriously volatile and of particular concern when that volatility results in the objectives not being met. Fortunately, there may be a way to predict the possibility of this type of disappointing outcome.

Cardiac stress tests have been conducted for many years by cardiologists. They are designed to identify a possible but not obvious weakness in the cardiac system under controlled conditions before it occurs in daily life. This concept is now applied in the financial industry via the Dodd Frank Act Stress Test (DFAST). Many non-financial companies are now designing stress tests of their own (Vaughan, 2008). Instead of just doing financial analysis on a mean case, companies now consider scenarios where disappointing combinations of different events combine together. The stress test will increase confidence that the portfolio will generate results required within designated controls (Schmieder, 2011).

Originally published as: MacKay, J. A., and G. P. Citron, 2016, Stress testing your portfolio of exploration projects: Gulf Coast Association of Geological Societies Transactions, v. 66, p. 353–356.

I have been investigating investment strategies applied in other industries. This is one example from the banking community.

The objective is to determine the impact of a series of unrelated negative events that might happen simultaneously.

We design exploration portfolios to meet certain financial objectives but are aware the results can be volatile and frequently underperform.

Although that volatility might result in a beneficial surprise it frequently is just the opposite.

Stress Testing All Projects....

Following the 2008 financial crisis, this process has become common for managing capital adequacy at major banks.

Projects can be tested to determine which are more sensitive to unpredictable negative results vs estimates.

Stress Testing All Projects....

Following the 2008 financial crisis, this process has become common for managing capital adequacy at major banks.

A stress test is designed to identify investments that are more sensitive to a run of bad luck than others.

For example, if the actual value, cost and chance are all optimistic by 10%, which projects will be most impacted?

Projects can be tested to determine which are more sensitive to unpredictable negative results vs estimates.

A rating criteria needs to be devised to compare performance with and without stress applied.

| | | | | ΡV | = (| G - C | | | | |

| J | \$ 926 | 40% | \$ | 125 | \$ | 801 | 1 | | | |
| | dollars in | Millions | | | | | 1 | | | |

I tested this portfolio of a sample of low to high risk, cost and value projects. First calculate the present value (PV).

| | | | x C | | | | | | |
|----------|------------|----------|------|-----|-------|-------|------|-------|--|
| | | | | | Pr | esent | Re | ative | |
| Prospect | Gain | Chance | Cost | | Value | | Risk | | |
| Name | (G) | (Pc) | (C) | | (PV) | | (RR) | | |
| А | \$ 1,107 | 24% | \$ | 177 | \$ | 930 | \$ | 135 | |
| В | \$ 542 | 18% | \$ | 72 | \$ | 470 | \$ | 59 | |
| С | \$ 129 | 76% | \$ | 47 | \$ | 82 | \$ | 11 | |
| D | \$ 2,333 | 28% | \$ | 146 | \$ | 2,187 | \$ | 105 | |
| Е | \$ 1,464 | 20% | \$ | 147 | \$ | 1,316 | \$ | 117 | |
| F | \$ 356 | 60% | \$ | 104 | \$ | 252 | \$ | 42 | |
| G | \$ 96 | 93% | \$ | 70 | \$ | 26 | \$ | 5 | |
| Н | \$ 1,540 | 45% | \$ | 140 | \$ | 1,400 | \$ | 77 | |
| Ι | \$ 1,440 | 40% | \$ | 190 | \$ | 1,250 | \$ | 114 | |
| J | \$ 926 | 40% | \$ | 125 | \$ | 801 | \$ | 75 | |
| | dollars in | Millions | | | | | | | |

Next calculate the relative risk (RR). It is a function of the cost at risk (C) times the chance of loss (1-Pc).

The Method: Rating Projects.... Read the paper for more detail

| | | | | | | | esent | Re | lative | Exp | Expected | |
|----------|------|----------|----------|------|-----|----|-------|----|--------|-------|----------|--|
| Prospect | Gain | | Chance | Cost | | ٧ | /alue | F | Risk | Value | | |
| Name | (G) | | (Pc) | | (C) | | (PV) | (| RR) | (EV) | | |
| А | \$ | 1,107 | 24% | \$ | 177 | \$ | 930 | \$ | 135 | \$ | 89 | |
| В | \$ | 542 | 18% | \$ | 72 | \$ | 470 | \$ | 59 | \$ | 25 | |
| С | \$ | 129 | 76% | \$ | 47 | \$ | 82 | \$ | 11 | \$ | 51 | |
| D | \$ | 2,333 | 28% | \$ | 146 | \$ | 2,187 | \$ | 105 | \$ | 510 | |
| Е | \$ | 1,464 | 20% | \$ | 147 | \$ | 1,316 | \$ | 117 | \$ | 150 | |
| F | \$ | 356 | 60% | \$ | 104 | \$ | 252 | \$ | 42 | \$ | 109 | |
| G | \$ | 96 | 93% | \$ | 70 | \$ | 26 | \$ | 5 | \$ | 19 | |
| Н | \$ | 1,540 | 45% | \$ | 140 | \$ | 1,400 | \$ | 77 | \$ | 553 | |
| I | \$ | 1,440 | 40% | \$ | 190 | \$ | 1,250 | \$ | 114 | \$ | 386 | |
| J | \$ | 926 | 40% | \$ | 125 | \$ | 801 | \$ | 75 | \$ | 245 | |
| | do | llars in | Millions | | | | | | | | | |

Third calculate the expected value.

The Method: Rating Projects.... Read the paper for more detail

| | | | | | | Present | | Relative | | ected | | |
|----------|------------|----------|-----|--------|----|---------|------|----------|-------|-------|--------|--|
| Prospect | Gain | Chance | C | Cost | | alue | Risk | | Value | | Rating | |
| Name | (G) | (Pc) | i i | (C) | | (PV) | | (RR) | | EV) | (RATE) | |
| А | \$ 1,107 | 24% | \$ | \$ 177 | | 930 | \$ | 135 | \$ | 89 | 0.7 | |
| В | \$ 542 | 18% | \$ | 72 | \$ | 470 | \$ | 59 | \$ | 25 | 0.4 | |
| С | \$ 129 | 76% | \$ | 47 | \$ | 82 | \$ | 11 | \$ | 51 | 4.6 | |
| D | \$ 2,333 | 28% | \$ | 146 | \$ | 2,187 | \$ | 105 | \$ | 510 | 4.9 | |
| Е | \$ 1,464 | 20% | \$ | 147 | \$ | 1,316 | \$ | 117 | \$ | 150 | 1.3 | |
| F | \$ 356 | 60% | \$ | 104 | \$ | 252 | \$ | 42 | \$ | 109 | 2.6 | |
| G | \$ 96 | 93% | \$ | 70 | \$ | 26 | \$ | 5 | \$ | 19 | 3.8 | |
| Н | \$ 1,540 | 45% | \$ | 140 | \$ | 1,400 | \$ | 77 | \$ | 553 | 7.2 | |
| I | \$ 1,440 | 40% | \$ | 190 | \$ | 1,250 | \$ | 114 | \$ | 386 | 3.4 | |
| J | \$ 926 | 40% | \$ | 125 | \$ | 801 | \$ | 75 | \$ | 245 | 3.3 | |
| | dollars in | Millions | | | | | | | | | | |

Finally apply a relative rating (RATE) based on the ratio of the expected value (EV) to the relative risk (RR).

| Higher Rank order is associated with larg | | | | | | | | | | | | | |
|---|------------|----------|----|------|---------|-------|------|-------|----------|------|--------|------|--|
| | | | | | Present | | Rel | ative | Expected | | | | |
| Prospect | Gain | Chance | C | Cost | Value | | F | Risk | V | alue | Rating | | |
| Name | (G) | (Pc) | | (C) | | (PV) | (RR) | | (EV) | | (RATE) | Rank | |
| А | \$ 1,107 | 24% | \$ | 177 | \$ | 930 | \$ | 135 | \$ | 89 | 0.7 | | |
| В | \$ 542 | 18% | \$ | 72 | \$ | 470 | \$ | 59 | \$ | 25 | 0.4 | | |
| С | \$ 129 | 76% | \$ | 47 | \$ | 82 | \$ | 11 | \$ | 51 | 4.6 | 3 | |
| D | \$ 2,333 | 28% | \$ | 146 | \$ | 2,187 | \$ | 105 | \$ | 510 | 4.9 | | |
| Е | \$ 1,464 | 20% | \$ | 147 | \$ | 1,316 | \$ | 117 | \$ | 150 | 1.3 | : | |
| F | \$ 356 | 60% | \$ | 104 | \$ | 252 | \$ | 42 | \$ | 109 | 2.6 | | |
| G | \$ 96 | 93% | \$ | 70 | \$ | 26 | \$ | 5 | \$ | 19 | 3.8 | - | |

A forced rank will identify the best projects (with respect to this criteria) with high rank values seven through ten. I will nest plot the relative risk verses the expected value.

In general this plot is similar to an efficient frontier. The most efficient projects with respect to the tradeoff of these two criterion are along the green line. The green line represents a consistent tradeoff that results in a RATE value of 4. The portfolio had RATE values less than one to over four. In general, for this portfolio, above 2 is good and less than 2 is not so good. This is a relative rating an different RATE values may apply to different portfolios.

The best location for projects is towards the upper left corner of highest reward for the lowest risk.

All the projects will decline in rating with stress but some significantly more than others. The minimum expected value was set to 1 to avoid negative numbers on a log plot.

This is a look at the dramatic difference in change of performance for two of the less attractive projects.

This is a look at the dramatic difference in change of performance for two of the more attractive projects.

The point is to be aware of the projects that are more sensitive to uncertainty.

The speaker, James MacKay, can be contacted at jamesmackay@roseassoc.com
